

Hospital Facilities Contracting Application (HFCA)

Streamlining the contracting process into one easily accessible online location

Challenge

Our client identified a need to build an **online contract management application** based on the existing Access modules.

The purpose of this application is to be a single-source processing aid for the facility claim processors and to replace a need to review and interpret complicated hospital contracts in a series of complex and only partially automated steps.

Solution

Step 1 - Detailed System Design

Vicert prepared this document that included a complete functional prototype that enabled the BSC team to further analyze business process modeling within the application

Step 2 - Application Development

The new application centralizes every aspect of the contracting process into one easily accessible, online location

Benefits

- The application streamlines the contracting process, making human resource operations more efficient, thus reducing the organization's workload for contractors and approvers
- Retrieval, storage and maintenance of all hospital contracts in various locations is less time consuming and more efficient
- Eliminated issues with multiple users in the Access application and increased productivity for the client
